```
protein (POSHL 1) polypeptide (1), comprising a sequence of 730 amino acids (S1, ABBB3999), a sequence having 65% sequence identity to (S1), acids (S1, ABBB3999), a sequence having 65% sequence identity to (S1), acids (S1, ABBB3999), a sequence having 65% sequence identity to (S1), acids (S1, ABBB3999), a sequence having 65% sequence identity to (S1), acids (S1, ABBB3999), a sequence having 65% sequence identity to (S1), acids (S1, ABBB3999), a sequence of congrishing at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful for identifying a specific binding partner. (I) and nucleic acids (II) for identifying a specific binding partner. (I) and nucleic acids (II) acused by altered expression of human POSHL1 including dispnosing and treating cancer, they useful in the development of vaccines and (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples of the invention. Note: The present sequence did not form part of the printed specification, but is based on sequence information supplied to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of individuals e.g. by determining immunogenetic differences when transplanting between them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base
                                                                               The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino APPRA 1999). a sequence having 65% sequence identity to (SI),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Moriya S, Nishida M;

                                                                                                                                                                요
                                                                                                                                                                                                              ö
oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility diagnosis of genetic diseases and identifying individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2-0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nucleocides and a 3' end modification of a 3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis.

encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-leaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least there of the S' terminal nucleotides and a 3' end modification of least three of the S' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid molecule of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                           Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      wnv; west Nile Virus; antiinflammatory; cytostatic; hepatotropic; virucide; neuroprotective; antibacterial; replication; pancreatitis; encephalitis; myocarditis; meningitis; infection; hepatitis; liver failure; cancer; clirhosis; Hammerhead; Inozyme; DNAzyme;

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatics, encephalitis, meningitis, neurologic infection, hepatitis, inversional infection e.g. pancreatics, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hammerhead, inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least ten 2'-0-methyl modifications, phosphorothicate linkages on at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5 terminal nucleotides and a 3 end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed, however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule that modulates replication of West Nile Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .

                                                                                                                                                                                                                                                                                                                                                                                                                                        of the West Nile virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of hammerhead, Inozyme, G-Cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nuclectides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid

of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, meningitis, neurologic infection, hepatitis, molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleocides and a 3' end modification of a 3'-3' inverted abasic molety. Nucleic acid molecules SEQ ID No 194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules that modulate replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MD23; MD24; MD212; chromosome 7g22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15g26.1; cancer; developmental disorder; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gарв

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 6721.3-22.2, MDZ7 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 572.1, mDZ7 is encoded at chromosome 1601.2 and MDZ12 is encoded at chromosome 582.2, mDZ7, MDZ7, MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful as therapeutic agents for gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

```
The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12. MDZ3 is cancoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p21.2 and MDZ12 is encoded at chromosome 16p2.3 and MDZ12 is encoded at chromosome 16p2.3 and MDZ12 is encoded at chromosome 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 are useful in therapy, or MDZ3, MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agente for gene therapy or as proteins are useful as therapeutic agente for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                               New zinc finger-containing proteins and nucleic acids, useful in manifacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                               acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule invention has cytostatic, anti-HIV, and anti-theumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABESS989 - ABES62216, ABZ6444 - ABZ65531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66530 - ABZ66520 - ABZ66524, ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Rag, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acid also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel short interfering RNA (aiRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences above in ABZ55989 - ABZ65216, ABZ65531, ABZ6520 - ABZ65524,
shown in ABZ59889 - ABZ65216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,
ABZ66530 - ABZ66585 represent substrate/target sequences for the human
ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        - ABZ66585 represent substrate/target sequences for the human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-theumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABESS989 - ABESG2216, ABESG531, ABESG520 - ABESG524, ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                 Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HBR2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K.Ras, H.Ras, N.Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K.Ras, H.Ras, and HIV activity in a cell. The nucleic acid stream the same useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABES9899 - ABES62216, ABE65531, ABE66520 - ABE66524, ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV, RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         amberzyme, G-cleaver ribozyme, decoy molecule, aptamer,

```
Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                     Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV; RNA stability; RNA expression; RNA synthesis, antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;
                                                                          amberzyme; G-cleaver ribozyme; decoy molecule; apramer;
HBV reverse transcriptase; Enhancer I region; viral replication;
degenerative; disease state; HBV infection; HCV infection; cirrhosis;
liver failure; hepatocellular cardinoma; hepatotropic; cytostatic;
            minus strand DNAzyme substrate sequence #1478.
                                                                                                                                  virucide; antiinflammatory; substrate; ss.
                                                                                                                                                                                                                                                                     26-MAR-2001; 2001US-00817879.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymatic nucleic acids such as harmerhead molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes, Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as Oligonucleotides that specifically bind the Enhancer I region of HBV genes and Alox people and Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression of HBV compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represents a substrate for one of the HCV interest of the compounds and carcinoma. The present sequence represents a substrate for one of the HCV interest.
                                                                                                                                                                                                                                                                                                                                                                                                              Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                           ٠<u>,</u>

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, amberzymes, amberzymes, and G-cleaver ribozymes, Also disclosed re nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligomucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or lapication and/or percential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and elsease states related to HBV and HCV infection, replication and gene carcinoma. The present sequence represente a substrate for one of the HCV DNAzyme or minus strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2.8%; Score 12.8; DB 1; Length 17; 87.5%; Pred.                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to nucleic acid molecules which modulate
the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
Hepatitis B virus (HHV) RNA. The nucleic acid molecules include antisense
and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
are nucleic acid decoy molecules and aptamers that bind to HBV reverse
transcriptase and/or HBV reverse transcriptase primer sequences, as well
as oligonucleotides that specifically bind the Enhancer I region of HBV
DNA. The nucleic acids may be used to modulate the expression of HBV
genes and HBV viral replication. Also disclosed is a method for screening
compounds and/or potential theraphse directed against HBV, and compounds
that modulate the expression and/or replication of HCV. The compounds and
methods of the invention are useful for the treatment of degenerative and
disease states related to HBV and HCV infection, replication and gene
expression such as cirrhosis, liver failure, and hepatocellular
                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

DNAzyme or minus strand DNAzyme sequences disclosed in the present
invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stabiltry of Heparitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule, Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; zinzyme; amberzyme; G-claever ribozyme; decoy molecule; aptemer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.
                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ρ,

inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonuclectides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HV. The compounds of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human phenotype-associated (PA) genes (I ; Appl3307-AbF13386) which contain a Single Nuclectide Polymorphism (SNP). The SNP is given in the sequence as a variant nucleotide Also claimed are methods for screening for agents which regulate the activity of a PA gene and reagents that modulate the activity of a PA purcleotide where the reagent is identified by the screening methods. The methods and compositions of the present invention are useful for prognosticating, diagnosing and treating cardiovascular diseases. Mypertension, restenosis, arterial inflammation, mayocardial infarction and stroke. The present sequence is a PCR primer, used in the examples from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cardiant; antiarteriosclerotic; vasotropic; cerebroprotective;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5, or 3, end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entitinflammatory servoid and ubiquinone. A composition of the invention has antiinflammatory servoid and ubiquinone, A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, communosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing benefitivity to adenosine, reducing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fip. Wipo: Allery wipo at fip. WIPO at the sequences.

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating; cerebrovascular accident, central
nervous system (CKS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rhematoid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischemeia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
gamma substrate sequence.
                                                                                                                                                               .;

```
The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin Dz receptor (PTGDR),
KappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. malanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifts and mutations within diseased cells or to detect the presence of a
character of the present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                          antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restemoisis, asthma; Crohn; adiasase; diabetes; obesity; autoimmune disease; lupus; multiple sclerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepais; allergic allergic rhinitis; atopic dermatitis; human PTGDR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

The nucleic acids of the invention are useful for treating; cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, is achaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermattis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR substrate sequence.

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin DZ receptor (PTGDR),
is papal kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or aethma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
is chaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine generate
carget RNA in a cell. The present RNA sequence represents a human NOGO
receptor amberzyme substrate sequence.

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NOGO, prostaglandin Dz receptor (FOTOR),
IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
C lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischemia/repetfusion injury, glomerulonephritis, sepsis, and allergic
conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
driftes and mutations within diseased cells or to detect the presence of a
target RNA in a cell. The present RNA sequence represents a human IKK-
gamma substrate sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, e.g. a hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, treating a patient having a condition associated with the level of GRID (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, cleaving or a GRID gene by contacting the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at least the novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleic acid molecule in a manner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acids of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and

                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung aliway or lung expression of a target polypeptide associated with lung aliway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cycestatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated

(M1) involves detecting an expression product of at least one gene (I) in a first brain tissue sample (T) suspected of being neoplastic, where (1) is chosen from any one of 255 genes (glioma endothelial markers (GEMs)) as given in specification, and comparing the expression of (I) in (T) with expression of (I) in a second normal brain tissue sample (R), where increased expression of (I) in (T) relative to (R), identifies (T) as likely to be neoplastic. Also described: (1) treating (M2) glioma involves contacting cells of the glioma with an antibody that specifically binds to a extracellular epitope; (2) identifying (M3) a test compound as potential anticancer or antiglioma drug involves contacting a test compound with the cell which expresses
inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing glioma by detecting expression product of any one of 255 genes, glioma endothelial markers, in brain tissue sample suspected of being neoplastic, and comparing the expression with expression in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            marker; GEM;

dentifying test compound as a potential anticancer drug if it decreases the expression of at least one gene; (3) identifying (M4) at test compound as a potential anticancer or antiglioma drug involves contacting a test compound with the cell which expresses mRNA of at least one gene; compound with the cell which expresses mRNA of at least one gene identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and identifying the test compound as a potential anticancer drug if it decreases the expression of at least one gene; and (4) inducing (M5) an immune response to glioma involves administering to a mammal, a protein or (1). (1) have cytostatic activities, and can be used to trigger immune destruction of glioma cells, and as immune response inducers. (M1) is useful for aiding in diagnosing glioma. (M2) is useful for treating multicature glioma in a human. (M3) is useful for inducing an immune response to a glioma in a human. (M3) is useful for inducing an immune response to a glioma in a mammal having glioma or in a mammal who has had a glioma surgically removed. The present sequence represents a human GEM content and a glioma cells. (M2) is useful for inducing an immune response to a glioma in a present sequence represents a human GEM content and a glioma cells. (M3) is useful for inducing an immune response to a glioma in a present sequence represents a human GEM content and a glioma cells.

The invention relates to an enzymatic nucleic acid molecule that comprising one or more binding arms, without requiring the presence of a 2.-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepaticallular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The mucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of a carget genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (\mathrm{HCV}), useful for the treatment of \mathrm{HCV} infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enzymatic nucleic acid; RNA cleavage; hepatitis C virus; HCV; infection; type I interferon; DNAzyme.
                                                                                                                                                                                                                                                                                                                                                                                .

from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Snzymatic nucleic acid molecules which specifically cleave RNA derived

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
interferons. The present sequence represents a HCV DNAzyme substrate

                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                          Enzymatic nucleic acid molecules which specifically cleave RNA derived from hepatitis C virus (HCV), useful for the treatment of HCV infections, especially in combination with type I interferon therapy.
                                                                                                                                                                                                                               The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type i interferons. The present sequence represents a HCV DNAzyme substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mutant cell identification-related mutagenic oligonucleotide SeqID752.

This invention relates to a novel method of identifying a cell having a desired oligonucleotide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonucleotide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonucleotide-directed sequence alteration at a first the production of plants with herbicide resistance, male or female sterile plants, abiotic stress tolerance, albino plants or plants with an altered amino acid production as well as for use in mammalian cell lines.
                                                                                                                                                                                                    Identifying a cell with a desired oligonucleotide-directed sequence alteration at a nucleic acid target site within the cell by identifying the desired sequence alteration in cells selected for the presence of a selectable phenotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of a mutagenic oligonucleotide which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mutant cell identification-related mutagenic oligonucleotide SeqID751.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cell identification; oligonucleotide-directed sequence alteration; selectable phenotype; transgenic plant; herbicide resistance; sterile plant; abiotic stress tolerance; albino plant; amino acid production; ss.

This invention relates to a novel method of identifying a cell having a desired oligonuclectide-directed sequence alteration at a first nucleic acid target site within the cell. The method comprises identifying the desired sequence alteration in cells that have been selected for the presence of a selectable phenotype conferred by a concurrent oligonuclectide-directed sequence alteration at a second nucleic acid target site within the cells. The method is useful in identifying a cell having a desired oligonuclectide-directed sequence alteration at a first nucleic acid target site within the cell. The method may be useful for the production of plants with harbicide resistance, male or female sterile plants, abjoict stress tolerance, albino plants or plants with alterance, albino plants or plants with alterance amino acid production as well as for use in mammalian cell lines. The present sequence is that of a mutagenic oligonucleotide which was the sequence is that of a mutagenic oligonucleotide which was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention relates to a method (M1) for selecting an animal for having desired genotypic or potential phenotypic properties. (M1) comprises testing the animal for the presence of a nucleic acid modification affecting: the activity of an evolutionary conserved CpG island located in intron 3 of an IGF2 gene; and/or binding of a nuclear factor to an IGF2 gene. The nuclear factor is capable of binding to a stretch of nucleotides which in the wild type pig, mouse or human IGF2 gene is part of an evolutionary conserved CpG island, located in intron 3 of the IGF2 gene. The stretch is functionally equivalent to (ADQ80709). The nucleic acid modification in ADQ80709 comprises a G to A translition at IGF2-intron3-nt3072. (M1) is useful for selecting an animal with properties related to muscle mass, fat deposition, and/or teat number. CC Also claimed is a method (M2) for modulating mNNA transcription of an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene. Also claimed is a method (M3) for identifying a compound capable of modulating mNNA transcription of an IGF2 gene and/or modulating of a nuclear factor to an IGF2 gene and/or modulating of a nuclear factor to an IGF2 gene and/or modulating planding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating binding of a nuclear factor to an IGF2 gene and/or modulating an activity muscle deficiencies and diabetes. The present sequence is a porcine sequence tagged sites (STS) comprising a porcine sequence in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Endocrine, Antiseborrheic; Dermatological; Depilatory; RNA interference;

The present invention relates to novel small interfering RNAs (siRNAs), comprising a double stranded RNA, where one strand comprises a partial nucleic acid sequence of an anadrogen signal transduction pathway protein, and where the double-stranded RNA inhibits translation of mRNA encoding the nucleic acid sequence of the androgen signal transduction pathway. The compress blocking the androgen signal transduction pathway. The androgen signal transduction pathway. The androgen signal transduction pathway is captured to a comparable (ADQ92455 and ADQ92516), the androgen are (ADQ92571), aromatase (ADQ92455 and ADQ92516), the androgen and II of 5-alpha reductase (ADQ93182), 3-beta-chydroxysteroiddehydrogenase (ADQ93182), 3-beta-chydroxysteroidde
                                                                                                                                                Inhibitory nucleic acid that inhibits expression of an androgen signal transduction pathway protein useful for treating hair loss, comprises a double stranded RNA having a partial sequence encoding a pathway protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Telomerase RNA; TR; promoter; cytotoxin; cancer; neoplasia; hTR; gene therapy; thymidine kinase gene; anticancer therapy; human; mutagenesis; PCR primer; ss.

The invention relates to promoter regions from mouse and human telomerase RNA (TR) component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cyctoxin, for therapy of cancer, especially neoplasias. The telomerase is necessary for the concer, especially neoplasias. The telomerase is necessary for the concer, especially neoplasias. The telomerase is necessary for the concertiated proliferative capacity of many human cancers. Mutation or concertiated proliferative capacity of many human cancers. Mutation or concertiated proliferative can be used to block transcription from the TR gene promoter through interaction of the 5' regulatory sequences. These canbstances, e.g. antisense oligomucleotides, transcription factors. Oppide mucleic acids and factors that disrupt signal transduction, are seful for cancer therapy. In particular, gene therapy vectors (especially pdf62-codaups) comprising the promoter and a viral thymidine concertaints and be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or treated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the hTR gene promoter callows the analysis of therapeutic molecules which modulate hTR promoter and manipulation of activity, Sequences Assorbede S121 represent PCR primers used in cloning

                                                                                                               Sequences shown in AAV41169 to AAV41181 represent antisense
oligonucleotides to the RNA component of human telomerase (hTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
equence within an accessible region of the hTR, but that does not
oligonucleotides may specifically be used for detection of an RNA
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitory
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitory
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitory
cancer (especially neuroblastoma cancer patient. The inhibitory assembly of
interfering with transcription of the RNA component, decreasing the half-
coligonucleotides can inhibit the component transcript, inhibiting assembly of
the RNA component into the telomerase holoenzyme, or inhibiting telomerase activity in both cultured cells and in
be used for inhibiting telomerase. These antisense oligonucleotides can
be used for inhibiting telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
immunosuppression, and for selectively down-regulating specific branches
of the immune system, e.g. a specific subset of T-cells, in anti-
inflammatory therapies or for treating infections by, e.g. yeast,

gene therapy

```
The intention retails to produce regions from mouse and intentions of the component genes. The TR gene promoter can be linked to a heterologous gene, especially a gene encoding a cytotoxin, for therapy of cancer, especially appeals are the telomerase is necessary for the unrestricted proliferative capacity of many human cancers. Mutation or dysregulation of the telomerase expression pathway may cause reactivation or dysregulation of telomerase expression in cancer. Substances, cor upregulation of telomerase expression in cancer. Substances, cor upregulation of telomerase expression in cancer. Substances, compared to the S' regulatory sequences. These gene promoter through interaction of the S' regulatory sequences. These causeful for cancer therapy. In particular, gene thrangulation, are useful for cancer therapy. In particular, gene thrangulation of especially pGT62-codAupp) comprising the promoter and a viral thymidine kinese gene can be used to convert a prodrug, e.g. gancyclovir, so that neoplasia can be controlled or tracated. Direct down-regulation of telomerase RNA gene through manipulation of transcription factors may be effective anticancer therapy and the cloning of the HTR gene promoter allows the analysis of therapeutic molecules which modulate HTR promoter activity. Sequences AAZO7696-321 represent PCR primers used in cloning and mutagenisis of human TR gene (HTR) promoter region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                      invention relates to promoter regions from mouse and human telomerase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a pair of RNA molecules (R1, R2) for detecting a first subunit protein (I) of telomerase. R1 and R2 both bind to (I) and have formulae 5'-A-B-C-3' (R1) 5'-D-E-F-3' (R2) where: A and B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pair of RNA molecules for detecting telomerase, useful for diagnosis of cancer or metastases, can be ligated when bound to telomerase subunit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, telomerase, hTR, telomeric repeat amplification protocol; TRAP,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 484
```

```
= RNA segment of 10 to 100000 nucleotides (nt) that together are replicated by RNA replicase; B and E = RNA segments of 10 to 250 nt trom the Y region of human telomerase and bind specifically to (1); C and D = RNA segments of 10 to 250 nt from the Y region of human telomerase and bind specifically to (1); C and D = C and D produces R3 of formula 5.-A-B-C-D-E-F-3' (R3) with E and B bound to (1). Replication of R3 by RNA replicase indicates presence of (1) to (1). Replication of R3 by RNA replicase indicates presence of (2) to this process containing R1, R2, ligase and an amplification system; and (3) method for making R1 R2, ligase and an amplification system; and (3) method for detect and quantify telomerase, particularly for diagnosis of cancer and for detection of metastases. R1 and R2 provide an assay that does not require expensive equipment or highly trained personnel, and is suitable for automation. The present sequence invention
RNA segment of 10 to 100000 nucleotides (nt) that together
                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention

RNA New ribonucleic acids useful for identifying naturally occurring RNA sequences having affinity for RNA-binding protein having protein and Example 2; Col 26; 36pp; English. components.

The specification describes a first RNA (RNA1) and a second RNA (RNA2) for use in binding an RNA-binding protein (RBP) having protein and RNA components. RNA1 has the formula 5'-A-B-C-3', where A is section having 10-100,000 nucleotides and is can be received by an RNA replicase and with another DNA sequence, F, being replicated; B is section having 10-3,000 nucleotides which have affinity to one consensus sequence of the RBP and which can bind to the protein component; C is section having about 1-20 nucleotides and which can be ligated to D of the second RNA molecule. RNA2 has the formula S'D-B-F-3', where D is section having 1-20 nucleotides and which can be ligated to C; E is section 10-3,000 nucleotides which have affinity to second consensus sequence of the RBP

```
The present invention describes a pair of RNA molecules (R1, R2) for detecting a first subunit protein (I) of telomerase. R1 and R2 both bind to (1) and have formulae 5'-A-B-C-3' (R1) 5'-D-B-F'3' (R2) where: A and F = RNA segment of 10 to 100000 nucleotides (nr) that together are replicated by RNA replicase; B and E = RNA segments of 10 to 250 nt from the Y region of human telomerase and bind specifically to (1); C and D = RNA segments of 1 to 10000 nt which can be ligated together. Ligation of C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D produces R3 of formula 5'-A-B-C-D-E-F-3' (R3) with E and B bound C C and D produces R3 of formula 8'-A-B-C-D-E-F-3' (R3) with E and B bound C C and (3) method for detecting (I) using R1 and R2' (1) kit for this process containing R1, R2, ligase and an amplification system; and (3) method for making R1 and R2 by transcription from appropriate DNA. R1 and R2 are used to detect and quantify telomerase, particularly for diagnosis of cancer and for detection of metastases. R1 and R2 process contained and assay that does not require expensive equipment or highly trained personnel, and is suitable for automation. The present sequence represents an oligonucleotide used in the exemplification of the present
                                                                                                                                                                                                                                                                                   ö
and which can bind to the protein component; F is section having 10-100,000 nucleotides which can be received by an RNA replicase and with A being replicated. RNA1 and RNA2 are capable of forming a third RNA (RNA3) of formula 5'A-B-C-D-E-F'3'. The method is useful for the identification and characterization of RNA sequences having specific affinity to amino acid consensus sequences of RBPs, and to RNAs. AAH24815-16 were used to produce a double-stranded RNA1, comprising the Y-1 domain of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; telomerase; hTR; telomeric repeat amplification protocol; TRAP; identification; detection; quantification; cancer; metastasis; ss.
                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pair of RNA molecules for detecting telomerase, useful for diagnosis cancer or metastases, can be ligated when bound to telomerase subunit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a first RNA (RNA1) and a second RNA (RNA2) for use in binding an RNA-binding protein (RBP) having protein and RNA components. RNA1 has the formula 5'-A=C-3', where A is section having 10-100,000 nucleotides and is can be received by an RNA replicase and with another DNA sequence, F, being replicated; B is section having 10-3,000 nucleotides which have affinity to one consensus sequence of the RNB and which can bind to the protein component; C is section having 10-300 nucleotides and which can be ligated to D of the second RNA molecule. RNA2 has the formula 5'-D-E-F-3', where D is section having 1-30 nucleotides which have affinity to second consensus sequence of the RNB continue and which can be ligated to C; E is section 10-3,000 nucleotides which have affinity to second consensus sequence of the RNB continue and protein component; F is section having 10-10,000 nucleotides which can be received by a RNA replicase and with A being replicated. RNA1 and RNA2 are capable of forming a third RNA (RNA3) of formula 5'A-B-C-D-E-F-3'. The method is useful for the identification and characterization of RNA sequences having specific affinity to amino acid consensus sequences of RRB9, and to RNAs. AAH24815-16 were used to produce a double-stranded RNA1, comprising the Y-1 domain of human

```

```
The invention comprises the amino acid and coding sequences of the human cholesteryl ester transfer protein (CETP), the invention also comprises bolymorphisms identified within the CETP gene. The DNA and protein sequences of the invention are useful in haplotyping and/or genotyping the CETP gene in an individual. The DNA and protein sequences may also be used to screen drugs or compounds targeting the CETP or its variant to treat a condition or disease associated with CETP (e.g. atherosclerosis, cardiovascular disease or hypercholesterolaemia). The present DNA sequence represents an allele specific oligonucleotide PCR primer for the
                                                                                                                                                                                                                                                                                                                                                                   human; cholesteryl ester transfer protein; CETP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-09-255-464B-16/c

Sequence 16, Application US/09255464B

Sequence 10, Application US/09255464B

Sequence 10, Application US/09255464B

GENERAL INFORMATION:
APPLICANT: Roninson, Igor
TITLE OF INVENTION: Identifying Naturally Occurring RNA Sequences Having
TITLE OF INVENTION: Affinity for RNA-Binding Proteins
FILE REPERENCE: Q001/004B

FILE REPERENCE: Q001/004B

CURRENT APPLICATION NUMBER: US/09/255,464B
